80		

81 Mathematically, various ways exist to represent applied general equilibrium (AGE) models,
82 according to Ginsburgh and Keyzer¹. To identify the optimal solution towards greater sustainability
83 and enable the efficient allocation of resources in the economy, we used the welfare format of the
84 AGE models for our analysis. In the supplementary information, we specified the model for our
85 study by explicitly considering producers, consumers, production goods, consumption goods, and
86 intermediate goods. Subsequently, we presented the calibration of our model. Finally, we provided
87 supplementary figures and tables, along with the sectoral aggregation scheme, social accounting
88 matrices, and emissions data for all the regions in our study.
89

90 **Supplementary Methods**

91 *Objective function*

92 The objective function "social welfare (W)" is the weighted sum of the log utility (U_i) of all
93 consumers, according to Zhu and Van Ierland².

$$94 \quad W = \max \sum_i \alpha_i \log U_i \quad (1)$$

95 where α_i is the Negishi weight of the representative consumer in each region i (i =China and its
96 main food and feed trading partners (MTP, including Brazil, United States, and Canada)).
97

98 *Utility function*

99 In our model, the consumer's utility depends on the consumption of rival goods. The utility function
100 is a Cobb-Douglas (C-D) function describing the behaviour of a representative consumer (household
101 to maximise its utility subject to budget constraints) consuming rival goods. The utility function of
102 the consumer in region i is written as:

$$103 \quad U_i = \prod_s C_{i,s}^{\beta_{i,s}} \quad (2)$$

104 where consumption goods s refers to cereal grains, oilseeds & pulses, vegetables & fruits, roots
105 & tubers, sugar crops, other non-food crops, monogastric livestock, ruminant livestock, other food,
106 fish, and non-food. $C_{i,s}$ is the consumption of the rival good in region i . $\beta_{i,s}$ is the elasticity of
107 utility concerning the consumption of rival good s in region i , i.e., the expenditure share of
108 consumption good s in consumption of rival goods in region i , and $\sum_s \beta_{i,s} = 1$.
109

110 *Production function*

111 We present the production functions of seventeen producers, namely, cereal grains, oilseeds &
112 pulses, vegetables & fruits, roots & tubers, sugar crops, other non-food crops, monogastric livestock,
113 ruminant livestock, compound feed, cereal brans, alcoholic pulps, oil cakes, other food, nitrogen
114 fertiliser, phosphorus fertiliser, fish, and non-food.
115

116 The production function of producer j in region i is specified as:

$$117 \quad Y_{i,j} = A_{i,j} [(KL_{i,j})^{\eta_{1i,j}} (LB_{i,j})^{\eta_{2i,j}} (LD1_{i,j})^{\eta_{3i,j}} (LD2_{i,j})^{\eta_{4i,j}} (NFE_{i,j})^{\eta_{5i,j}} (PFE_{i,j})^{\eta_{6i,j}}$$

$$118 \quad (CER_{i,j})^{\eta_{7i,j}} (OSD_{i,j})^{\eta_{8i,j}} (VF_{i,j})^{\eta_{9i,j}} (RT_{i,j})^{\eta_{10i,j}} (SGR_{i,j})^{\eta_{11i,j}} (OTC_{i,j})^{\eta_{12i,j}}$$

$$119 \quad (COF_{i,j})^{\eta_{13i,j}} (BRAN_{i,j})^{\eta_{14i,j}} (PULP_{i,j})^{\eta_{15i,j}} (CAKE_{i,j})^{\eta_{16i,j}}]^{1-\xi_{i,j}}$$

$$\begin{aligned}
& [(CERW_{i,j})^{\delta_{1i,j}}(OSDW_{i,j})^{\delta_{2i,j}}(VFW_{i,j})^{\delta_{3i,j}}(RTW_{i,j})^{\delta_{4i,j}} \\
& (BRANW_{i,j})^{\delta_{5i,j}}(PULPW_{i,j})^{\delta_{6i,j}}(CAKEW_{i,j})^{\delta_{7i,j}}] \xi_{i,j}
\end{aligned} \tag{3}$$

where $Y_{i,j}$ is the production of sector j in region i . $A_{i,j}$ is the technological parameter of the production of sector j in region i . $KL_{i,j}$, $LB_{i,j}$, $LD1_{i,j}$ and $LD2_{i,j}$ are capital, labour, cropland, and pasture land inputs for production j in region i , respectively. $NFE_{i,j}$, $PFE_{i,j}$, $CER_{i,j}$, $OSD_{i,j}$, $VF_{i,j}$, $RT_{i,j}$, $SGR_{i,j}$, $OTC_{i,j}$, $COF_{i,j}$, $BRAN_{i,j}$, $PULP_{i,j}$, and $CAKE_{i,j}$ are nitrogen fertiliser, phosphorus fertiliser, cereal grains, oilseeds & pulses, vegetables & fruits, roots & tubers, sugar crops, other non-food crops, compound feed, cereal bran, alcoholic pulp, and oil cake inputs for the production of sector j in region i , respectively. $CERW_{i,j}$, $OSDW_{i,j}$, $VFW_{i,j}$, $RTW_{i,j}$, $BRANW_{i,j}$, $PULPW_{i,j}$, and $CAKEW_{i,j}$ are food waste (i.e., cereal grains waste, oilseeds & pulses waste, vegetables & fruits waste, roots & tubers waste, cereal bran waste, alcoholic pup waste, and oil cake waste) recycling service as feed input for the production of sector j in region i , respectively. $\xi_{i,j}$ ($0 < \xi_{i,j} < 1$) is the cost share of food waste for the production of sector j in region i . η_f ($f=1, 2, 3, \dots, 16$) is the cost share of each factor and intermediate input for production, and $\sum_{f=1}^{16} \eta_f = 1$. δ_f ($f=1, 2, 3, \dots, 7$) is the cost share of each food waste input for production, and $\sum_{f=1}^7 \delta_f = 1$.

When emissions are outputs of the production process, the emissions intensities of greenhouse gases (GHGs) ($\varepsilon_{gg,i,j}$, kg CO₂ equivalent USD⁻¹), acidification pollutants ($\varepsilon_{ga,i,j}$, kg NH₃ equivalent USD⁻¹), and eutrophication pollutants (EP, $\varepsilon_{ge,i,j}$, kg N equivalent USD⁻¹) from producer j in region i are calculated as:

$$\varepsilon_{gg,i,j} = \frac{EM_{gg,i,j}^{+0}}{Y_{i,j}^0} \tag{4}$$

$$\varepsilon_{ga,i,j} = \frac{EM_{ga,i,j}^{+0}}{Y_{i,j}^0} \tag{5}$$

$$\varepsilon_{ge,i,j} = \frac{EM_{ge,i,j}^{+0}}{Y_{i,j}^0} \tag{6}$$

where $EM_{gg,i,j}^{+0}$ is the emissions of GHGs gg ($gg=CO_2$, CH_4 , and N_2O emissions) from producer j in region i in the base run. $EM_{ga,i,j}^{+0}$ is the emissions of acidification pollutants ga ($ga=NH_3$, NO_x , and SO_2 emissions) from producer j in region i in the base run. $EM_{ge,i,j}^{+0}$ is the emissions of eutrophication pollutants ge ($ge= N$ and P losses) from producer j in region i in the base run. $Y_{i,j}^0$ is the production of producer j in region i in the base run.

Next, the emissions in different scenarios are calculated by multiplying the current production level by corresponding emission intensities. The total emissions of GHGs, acidification and eutrophication pollutants from all producers in region i are calculated as follows:

$$EMG_{i,j}^+ = \sum_{gg} \varepsilon_{gg,i,j} * Y_{i,j} * Eqv_{gg}$$

for emissions of GHGs $gg = CO_2$, CH_4 , and N_2O emissions

$$EMA_{i,j}^+ = \sum_{ga} \varepsilon_{ga,i,j} * Y_{i,j} * Eqv_{ga} \tag{7}$$

159 for emissions of acidification pollutants $ga = \text{NH}_3, \text{NO}_x, \text{and SO}_2$ emissions
 160 (8)

161
$$EME_{i,j}^+ = \sum_{ge} \varepsilon_{ge,i,j} * Y_{i,j} * Eqv_{ge}$$

 162 for emissions of eutrophication pollutants $ge = \text{N and P losses}$
 163 (9)

164 where $EMG_{i,j}^+, EMA_{i,j}^+, \text{ and } EME_{i,j}^+$ are the total emissions of GHGs, acidification and
 165 eutrophication pollutants from producer j in region i , respectively. $Eqv_{gg}, Eqv_{ga}, \text{ and } Eqv_{ge}$
 166 are the GWP, AP, and EP equivalent factors based on Goedkoop, et al. ³.

167

168 *Balance equations*

169 In our applied model, we consider factor inputs (i.e., capital, labour, and land) to be mobile between
 170 different sectors but immobile between China and MTP. Cereal grains, oilseeds & pulses, vegetables
 171 & fruits, roots & tubers, and other non-food crops are used for direct consumption and intermediate
 172 use for monogastric livestock, ruminant livestock, compound feed, by-products (i.e., cereal bran,
 173 alcoholic pulp, and oil cake), and other food production. By-products (i.e., cereal bran, alcoholic
 174 pulp, and oil cake) and compound feed are produced for intermediate use for monogastric livestock
 175 and ruminant livestock production. Monogastric livestock, ruminant livestock, fish, other food, and
 176 non-food are used for direct consumption. Nitrogen fertiliser and phosphorus fertiliser are used for
 177 cereal grains, oilseeds & pulses, vegetables & fruits, roots & tubers, and other non-food crops
 178 production but not for consumption. We note C for consumption, XNET for net export (exports
 179 minus imports), and Y for production. Variables with a bar stand for exogenous ones.

180

181 The balance equations for cereal grains, oilseeds & pulses, vegetables & fruits, roots & tubers, and
 182 other non-food crops in region i are as follows:

183
$$C_{i,cer} + CER_{i,oap} + CER_{i,ctl} + CER_{i,cof} + CER_{i,bran} + CER_{i,pulp} + CER_{i,otf} + XNET_{i,cer} \leq$$

 184
$$Y_{i,cer} \quad (p_{i,cer})$$

 185 (10)

186
$$C_{i,osd} + OSD_{i,oap} + OSD_{i,ctl} + OSD_{i,cof} + OSD_{i,cake} + OSD_{i,otf} + XNET_{i,osd} \leq$$

 187
$$Y_{i,osd} \quad (p_{i,osd})$$

 188 (11)

189
$$C_{i,vf} + VF_{i,oap} + VF_{i,ctl} + VF_{i,cof} + VF_{i,otf} + XNET_{i,vf} \leq Y_{i,vf} \quad (p_{i,vf})$$

 190 (12)

191
$$C_{i,rt} + RT_{i,oap} + RT_{i,ctl} + RT_{i,cof} + RT_{i,otf} + XNET_{i,rt} \leq Y_{i,rt} \quad (p_{i,rt})$$

 192 (13)

193
$$C_{i,sgr} + SGR_{i,oap} + SGR_{i,ctl} + SGR_{i,cof} + SGR_{i,otf} + XNET_{i,sgr} \leq Y_{i,sgr} \quad (p_{i,sgr})$$

 194 (14)

195
$$C_{i,ocr} + OCR_{i,oap} + OCR_{i,ctl} + OCR_{i,cof} + OCR_{i,otf} + XNET_{i,ocr} \leq Y_{i,ocr} \quad (p_{i,ocr})$$

 196 (15)

197 where $CER_{i,oap}, CER_{i,ctl}, CER_{i,cof}, CER_{i,bran}, CER_{i,pulp}, \text{ and } CER_{i,otf}$ are cereals used for
 198 monogastric livestock, ruminant livestock, compound feed, cereal bran, alcoholic pulp, and other
 199 food production in region i , respectively. $OSD_{i,oap}, OSD_{i,ctl}, OSD_{i,cof}, OSD_{i,bran}, \text{ and } OSD_{i,otf}$
 200 are cereals used for monogastric livestock, ruminant livestock, compound feed, oil cake, and other
 201 food production in region i , respectively. $VF_{i,oap}, VF_{i,ctl}, VF_{i,cof}, \text{ and } VF_{i,otf}$ are vegetables &
 202 fruits used for monogastric livestock, ruminant livestock, compound feed, and other food production

203 in region i , respectively. $RT_{i,oap}$, $RT_{i,ctl}$, $RT_{i,cof}$, and $RT_{i,otf}$ are roots & tubers used for
 204 monogastric livestock, ruminant livestock, compound feed, and other food production in region i ,
 205 respectively. $SGR_{i,oap}$, $SGR_{i,ctl}$, $SGR_{i,cof}$, and $SGR_{i,otf}$ are sugar crops used for monogastric
 206 livestock, ruminant livestock, compound feed, and other food production in region i , respectively.
 207 $OCR_{i,oap}$, $OCR_{i,ctl}$, $OTC_{i,cof}$, and $OTC_{i,otf}$ are other non-food crops used for monogastric
 208 livestock, ruminant livestock, compound feed, and other food production in region i , respectively.
 209 $p_{i,cer}$, $p_{i,osd}$, $p_{i,vf}$, $p_{i,rt}$, $p_{i,sgr}$, and $p_{i,ocr}$ are the shadow prices of cereal grains, oilseeds &
 210 pulses, vegetables & fruits, roots & tubers, and other non-food crops in region i , respectively.

211

212 The balance equation for by-products (i.e., cereal bran, alcoholic pulp, and oil cake) in region i is
 213 as follows:

$$214 \quad BRAN_{i,oap} + XNET_{i,bran} \leq Y_{i,bran} \quad (p_{i,bran}) \quad (16)$$

$$215 \quad PULP_{i,oap} + XNET_{i,pulp} \leq Y_{i,pulp} \quad (p_{i,pulp}) \quad (17)$$

$$216 \quad CAKE_{i,oap} + XNET_{i,cake} \leq Y_{i,cake} \quad (p_{i,cake}) \quad (18)$$

217 where $BRAN_{i,oap}$, $PULP_{i,oap}$, and $CAKE_{i,oap}$ are cereal bran, alcoholic pulp, and oil cake used
 218 for monogastric livestock production in region i , respectively. $p_{i,bran}$, $p_{i,pulp}$, and $p_{i,cake}$ are the
 219 shadow prices of cereal bran, alcoholic pulp, and oil cake in region i .

220

221 The balance equation for compound feed in region i is as follows:

$$222 \quad COF_{i,oap} + COF_{i,ctl} + XNET_{i,cof} \leq Y_{i,cof} \quad (p_{i,cof}) \quad (19)$$

223 where $COF_{i,oap}$ and $COF_{i,ctl}$ are compound feed used in monogastric livestock and ruminant
 224 livestock production in region i , respectively. $p_{i,cof}$ is the shadow price of compound feed in
 225 region i .

226

227 The balance equation for monogastric livestock, ruminant livestock, fish, other food, and non-food
 228 in region i is as follows:

$$229 \quad C_{i,j} + XNET_{i,j} \leq Y_{i,j} \quad (p_{i,j}) \quad (20)$$

230 where $p_{i,j}$ is the shadow price of good j in region i .

231

232 The balance equation for nitrogen and phosphorus fertiliser in region i is as follows:

$$233 \quad NFE_{i,cer} + NFE_{i,osd} + NFE_{i,vf} + NFE_{i,rt} + NFE_{i,sgr} + NFE_{i,ocr} \\ 234 \quad + XNET_{i,nfe} \leq Y_{i,nfe} \quad (p_{i,nfe}) \quad (21)$$

$$235 \quad PFE_{i,cer} + PFE_{i,osd} + PFE_{i,vf} + PFE_{i,rt} + PFE_{i,sgr} + PFE_{i,ocr} \\ 236 \quad + XNET_{i,pfe} \leq Y_{i,pfe} \quad (p_{i,pfe}) \quad (22)$$

237

238 where $NFE_{i,cer}$, $NFE_{i,osd}$, $NFE_{i,vf}$, $NFE_{i,rt}$, $NFE_{i,sgr}$ and $NFE_{i,ocr}$ are the nitrogen fertiliser
 239 used for cereal grains, oilseeds & pulses, vegetables & fruits, roots & tubers, and other non-food
 240 crops production in region i , respectively. $PFE_{i,cer}$, $PFE_{i,osd}$, $PFE_{i,vf}$, $PFE_{i,rt}$, $PFE_{i,sgr}$ and
 241

247 $PFE_{i,ocr}$ are the phosphorus fertiliser used for cereal grains, oilseeds & pulses, vegetables & fruits,
 248 roots & tubers, and other non-food crops production in region i , respectively. $p_{i,nfe}$ and $p_{i,pfe}$
 249 are the shadow prices of nitrogen fertiliser and phosphorus fertiliser in region i , respectively.

250

251 For trade balance of all goods:

$$252 \quad \sum_i XNET_{i,j} = 0 \quad (p_j) \quad (23)$$

253

254 In the applied model, we assume that factor endowments (i.e., capital, labour, cropland, and pasture
 255 land) are mobile between different sectors but immobile among the two regions. For the balance
 256 equations of production factor inputs:

$$257 \quad \sum_j KL_{i,j} \leq \overline{KL}_i \quad (r_i) \quad (24)$$

$$258 \quad \sum_j LB_{i,j} \leq \overline{LB}_i \quad (w_i) \quad (25)$$

$$259 \quad \sum_j LD1_{i,j} \leq \overline{LD1}_i \quad (k1_i)$$

260 for sector j = cereal grains, oilseeds & pulses, vegetables & fruits, roots & tubers, and other non-
 261 food crops

$$262 \quad \sum_j LD2_{i,j} \leq \overline{LD2}_i \quad (k2_i) \quad (26)$$

$$263 \quad \sum_j LD2_{i,j} \leq \overline{LD2}_i \quad (k2_i)$$

264 for sector j = ruminant livestock

$$265 \quad \sum_j LD2_{i,j} \leq \overline{LD2}_i \quad (k2_i) \quad (27)$$

266

267 where \overline{KL}_i , \overline{LB}_i , $\overline{LD1}_i$ and $\overline{LD2}_i$ are the factor endowments (i.e., capital, labour, cropland,
 268 pasture land) supply in region i , respectively. r_i , w_i , $k1_i$, and $k2_i$ are the shadow prices of
 269 capital, labour, cropland, and pasture land in region i , respectively.

270

271 If an emission permit system is implemented to control the total emissions of GHGs, acidification
 272 and eutrophication pollutants from all producers, then the following relationship holds:

$$273 \quad \sum_j EMG_{i,j}^+ \leq \overline{TMG}_i^+ \quad (p_{eg,i}) \quad (28)$$

$$274 \quad \sum_j EMA_{i,j}^+ \leq \overline{TMA}_i^+ \quad (p_{ea,i}) \quad (29)$$

$$275 \quad \sum_j EME_{i,j}^+ \leq \overline{TME}_i^+ \quad (p_{ee,i}) \quad (30)$$

276 where \overline{TMG}_i^+ , \overline{TMA}_i^+ , and \overline{TME}_i^+ are the total emissions of GHGs, acidification and
 277 eutrophication pollutants from all producers in region i , respectively. \overline{TMG}_i^+ , \overline{TMA}_i^+ , and

278 \overline{TME}_i^+ are the permitted level of the total emissions of GHGs, acidification and eutrophication

279 pollutants in region i , respectively. Emissions should not be above a certain level for the
 280 regeneration of the environment. For benchmarking, the permitted emission level is the total
 281 emission level in the base year. For an environmental policy study, the permitted emission level can
 282 be an exogenous emission permit determined by the ecological limit. $p_{eg,i}$, $p_{ea,i}$, and $p_{ee,i}$ are the
 283 shadow prices of the emissions of GHGs, acidification and eutrophication pollutants in region i ,
 284 respectively.

285

286 Monogastric livestock's total demand for food waste recycling service must be equal to or less than
 287 the total supply of food waste recycling service, then the following relationship holds:

$$288 \quad CERW_{i,oap} \leq \overline{CERW_{i,oap}} \quad (p_{i,cerw1}) \quad (31)$$

$$289 \quad OSDW_{i,oap} \leq \overline{OSDW_{i,oap}} \quad (p_{i,osdw1}) \quad (32)$$

$$290 \quad VFW_{i,oap} \leq \overline{VFW_{i,oap}} \quad (p_{i,vfw1}) \quad (33)$$

$$291 \quad RTW_{i,oap} \leq \overline{RTW_{i,oap}} \quad (p_{i,rtw1}) \quad (34)$$

$$292 \quad BRANW_{i,oap} \leq \overline{BRANW_{i,oap}} \quad (p_{i,branw1}) \quad (35)$$

$$293 \quad PULPW_{i,oap} \leq \overline{PULPW_{i,oap}} \quad (p_{i,pulpw1}) \quad (36)$$

$$294 \quad CAKEW_{i,oap} \leq \overline{CAKEW_{i,oap}} \quad (p_{i,cakew1}) \quad (37)$$

295 where $\overline{CERW_{i,oap}}$, $\overline{OSDW_{i,oap}}$, $\overline{VFW_{i,oap}}$, $\overline{RTW_{i,oap}}$, $\overline{BRANW_{i,oap}}$, $\overline{PULPW_{i,oap}}$, and
 296 $\overline{CAKEW_{i,oap}}$ are the total supply of food waste (i.e., cereal grains waste, oilseeds & pulses waste,
 297 vegetables & fruits waste, roots & tubers waste, cereal bran waste, alcoholic pup waste, and oil cake
 298 waste) recycling service. $p_{i,cerw1}$, $p_{i,osdw1}$, $p_{i,vfw1}$, $p_{i,rtw1}$, $p_{i,branw1}$, $p_{i,pulpw1}$, and $p_{i,cakew1}$
 299 are the shadow prices of food waste (i.e., cereal grains waste, oilseeds & pulses waste, vegetables
 300 & fruits waste, roots & tubers waste, cereal bran waste, alcoholic pup waste, and oil cake waste)
 301 recycling service.

302

303 Consumer's total demand for food waste collection service must be equal to or less than the total
 304 supply of food waste collection service, then the following relationship holds:

$$305 \quad C_{i,cerw} \leq \overline{C_{i,cerw}} \quad (p_{i,cerw2}) \quad (38)$$

$$306 \quad C_{i,osdw} \leq \overline{C_{i,osdw}} \quad (p_{i,osdw2}) \quad (39)$$

$$307 \quad C_{i,vfw} \leq \overline{C_{i,vfw}} \quad (p_{i,vfw2}) \quad (40)$$

$$308 \quad C_{i,rtw} \leq \overline{C_{i,rtw}} \quad (p_{i,rtw2}) \quad (41)$$

$$309 \quad C_{i,branw} \leq \overline{C_{i,branw}} \quad (p_{i,branw2}) \quad (42)$$

$$310 \quad C_{i,pulpw} \leq \overline{C_{i,pulpw}} \quad (p_{i,pulpw2}) \quad (43)$$

$$311 \quad C_{i,cakew} \leq \overline{C_{i,cakew}} \quad (p_{i,cakew2}) \quad (44)$$

312 where $C_{i,cerw}$, $C_{i,osdw}$, $C_{i,vfw}$, $C_{i,rtw}$, $C_{i,branw}$, $C_{i,pulpw}$, and $C_{i,cakew}$ are the total supply of
 313 food waste (i.e., cereal grains waste, oilseeds & pulses waste, vegetables & fruits waste, roots &
 314 tubers waste, cereal bran waste, alcoholic pup waste, and oil cake waste) collection service. $p_{i,cerw2}$,
 315 $p_{i,osdw2}$, $p_{i,vfw2}$, $p_{i,rtw2}$, $p_{i,branw2}$, $p_{i,pulpw2}$, and $p_{i,cakew2}$ are the shadow prices of food waste
 316 (i.e., cereal grains waste, oilseeds & pulses waste, vegetables & fruits waste, roots & tubers waste,
 317 cereal bran waste, alcoholic pup waste, and oil cake waste) collection service.

318

319 *Budget constraint*

320 The budget constraint for a consumer i holds such that the expenditure must be equal to the income:

$$321 \quad \sum_s (p_{i,s} C_{i,s}) + \sum_j (p_j XNET_{i,j}) + p_{i,cerw2} C_{i,cerw} + p_{i,osdw2} C_{i,osdw} + p_{i,vfw2} C_{i,vfw} +
 322 \quad p_{i,rtw2} C_{i,rtw} + p_{i,branw2} C_{i,branw} + p_{i,pulpw2} C_{i,pulpw} + p_{i,cakew2} C_{i,cakew} = h_i \quad (45)$$

323 where consumption goods s refers to cereal grains, oilseeds & pulses, vegetables & fruits, roots
 324 & tubers, sugar crops, other non-food crops, monogastric livestock, ruminant livestock, other food,
 325 fish, and non-food. $\sum_s (p_{i,s} C_{i,s})$ is the total expenditure on the consumption goods in region i .
 326 $p_{i,cerw2} C_{i,cerw}$, $p_{i,osdw2} C_{i,osdw}$, $p_{i,vfw2} C_{i,vfw}$, $p_{i,rtw2} C_{i,rtw}$, $p_{i,branw2} C_{i,branw}$,
 327 $p_{i,pulpw2} C_{i,pulpw}$, and $p_{i,cakew2} C_{i,cakew}$ are the payments to the food waste (i.e., cereal grains waste,
 328 oilseeds & pulses waste, vegetables & fruits waste, roots & tubers waste, cereal bran waste, alcoholic
 329 pup waste, and oil cake waste) collection service in region i . The Negishi weight (α_i) in the welfare

330 function (equation 1) will be chosen such that the budget constraints hold for each representative
 331 consumer in region i .

332

333 Consumer's income is the sum of the remuneration of initial endowments employed in production
 334 and payments to the food waste collection service sector. Since goods are tradable, the consumer's
 335 income should exclude the export part. Thus, the consumer's income is:

$$\begin{aligned}
 336 \quad h_i = & r_i \overline{KL}_i + w_i \overline{LB}_i + k1_i \overline{LD1}_i + k2_i \overline{LD2}_i - \sum_j (p_j XNET_{i,j}) + p_{i,cerw1} CERW_{i,oap} + \\
 337 \quad & p_{i,osdw1} OSDW_{i,oap} + p_{i,vfw1} VFW_{i,oap} + p_{i,rtw1} RTW_{i,oap} + p_{i,branw1} BRANW_{i,oap} + \\
 338 \quad & p_{i,pulpw1} PULPW_{i,oap} + p_{i,cakew1} CAKEW_{i,oap} + p_{i,cerw2} C_{i,cerw} + p_{i,osdw2} C_{i,osdw} + \\
 339 \quad & p_{i,vfw2} C_{i,vfw} + p_{i,rtw2} C_{i,rtw} + p_{i,branw2} C_{i,branw} + p_{i,pulpw2} C_{i,pulpw} + p_{i,cakew2} C_{i,cakew} \\
 340 \quad & \hspace{15em} (46)
 \end{aligned}$$

341 where $\sum_j (p_j XNET_{i,j})$ is the income from exports. $p_{i,cerw1} CERW_{i,oap}$, $p_{i,osdw1} OSDW_{i,oap}$,
 342 $p_{i,vfw1} VFW_{i,oap}$, $p_{i,rtw1} RTW_{i,oap}$, $p_{i,branw1} BRANW_{i,oap}$, $p_{i,pulpw1} PULPW_{i,oap}$, and
 343 $p_{i,cakew1} CAKEW_{i,oap}$ are the income from food waste recycling service in region i .
 344 $p_{i,cerw2} C_{i,cerw}$, $p_{i,osdw2} C_{i,osdw}$, $p_{i,vfw2} C_{i,vfw}$, $p_{i,rtw2} C_{i,rtw}$, $p_{i,branw2} C_{i,branw}$,
 345 $p_{i,pulpw2} C_{i,pulpw}$, and $p_{i,cakew2} C_{i,cakew}$ are the income from food waste collection service in
 346 region i .

347

348 The producers' profits are specified as follows:

$$\begin{aligned}
 349 \quad PROF_{i,j} = & p_j Y_{i,j} - r_i KL_{i,j} - w_i LB_{i,j} - k1_i LD1_{i,j} - k2_i LD2_{i,j} - p_{cer} CER_{i,j} - p_{osd} OSD_{i,j} - \\
 350 \quad & p_{vf} VF_{i,j} - p_{rt} RT_{i,j} - p_{sgr} SGR_{i,j} - p_{ocr} OCR_{i,j} - p_{cof} COF_{i,j} - p_{bran} BRAN_{i,j} - p_{pulp} PULP_{i,j} - \\
 351 \quad & p_{cake} CAKE_{i,j} - p_{nfe} NFE_{i,j} - p_{pfe} PFE_{i,j} - p_{i,cerw1} CERW_{i,oap} - p_{i,osdw1} OSDW_{i,oap} - \\
 352 \quad & p_{i,vfw1} VFW_{i,oap} - p_{i,rtw1} RTW_{i,oap} - p_{i,branw1} BRANW_{i,oap} - p_{i,pulpw1} PULPW_{i,oap} - \\
 353 \quad & p_{i,cakew1} CAKEW_{i,oap} \\
 354 \quad & \hspace{15em} (47)
 \end{aligned}$$

355

356 *Model calibration*

357 As in the literature on AGE models, we followed the Harberger convention ⁴ to calibrate the model
 358 using the base year SAMs. It means that the prices of all goods and factors are set to one, and the
 359 quantities of consumption and production goods equal the monetary value of the base year SAMs ⁵.
 360 We calibrate the parameters in production and utility functions based on the cost shares of inputs in
 361 total production output and expenditure shares of consumption goods in total expenditure. In order
 362 to calibrate food waste-related parameters and add food waste (i.e., cereal grains waste, oilseeds &
 363 pulses waste, vegetables & fruits waste, roots & tubers waste, cereal bran waste, alcoholic pup waste,
 364 and oil cake waste) into the SAMs (see Supplementary Tables 10-11), our model treats food waste
 365 recycling service as feed input for monogastric livestock production (see equation (3)), and assumes
 366 that consumer buys food waste collection service for consumption (see equation (45)).

399 Supplementary Fig. 10 | Percentage changes (%) in prices by sectors in scenarios with respect to S0.

400 **Supplementary Tables**

401

402 Supplementary Table 1 | Physical quantities (Tg) for each product or service in China (CN) and its
403 main food and feed trading partners (MTP) in S0.

	CN	MTP
Cereal grains ^a	521.33	595.93
Oilseeds & pulses ^a	74.04	255.65
Vegetables & fruits ^a	572.24	116.39
Roots & tubers ^a	133.14	54.76
Sugar crops ^a	133.61	792.67
Other non-food crops ^a	24.98	19.27
Monogastric livestock ^a	103.15	18.65
Ruminant livestock ^a	52.53	46.28
Fish ^b	12.51	0.66
Compound feed ^c	128.00	103.10
Cereal bran ^d	11.37	12.01
Alcoholic pulp ^d	3.41	76.09
Oil cake ^d	58.06	84.02
Grass ^e	286.22	0.00
Nitrogen fertiliser ^a	39.60	13.65
Phosphorous fertiliser ^a	17.43	3.13

404 ^a Physical quantities of cereal grains, oilseeds & pulses, vegetables & fruits, roots & tubers, sugar
405 crops, other non-food crops, monogastric livestock, ruminant livestock, nitrogen fertiliser, and
406 phosphorous fertiliser were obtained from FAO ⁶. Here physical quantities of cereal grains waste,
407 oilseeds & pulses waste, vegetables & fruits waste, and roots & tubers waste were excluded and
408 presented in Table A3.

409 ^b Fish production data was derived from FAO ⁷.

410 ^c Compound feed production data was calculated according to the weighted averages of feeding
411 crops included in the compound feed at the national level.

412 ^d Physical quantities of cereal bran, alcoholic pulp, and oil cake were estimated from the
413 consumption of corresponding food products and specific technical conversion factors ⁸. Here,
414 physical quantities of cereal bran, alcoholic pulp, and oil cake only include quantities recycled as
415 feed for monogastric livestock, and quantities collected as waste for landfill and incineration are
416 excluded and presented in Table A3.

417 ^e Grass from natural grassland was derived from Miao and Zhang ⁹. Here, grass refers to grass from
418 natural grassland where ruminant livestock is grazing for feed, and grass from remaining grassland
419 is not included. We do not present grass production data in MTP due to data unavailability.

420 Supplementary Table 2 | Physical quantities (Tg) of food waste and food processing by-products and their utilisation in the baseline (S0) for China.

	Total (Tg)	Used as feed (%)	Unused biomass (%) ^c
Cereals waste	36.09	39% ^a	Landfill (40%) & incineration (21%)
Vegetables & fruits waste	175.01	39% ^a	Landfill (40%) & incineration (21%)
Roots & tubers waste	13.32	39% ^a	Landfill (40%) & incineration (21%)
Oil seeds & pulses waste	1.27	39% ^a	Landfill (40%) & incineration (21%)
Cereal bran	31.34	36% ^b	Landfill (42%) & incineration (22%)
Alcoholic pulp	42.34	16% ^b	Landfill (55%) & incineration (29%)
Oil cake	84.66	72% ^b	Landfill (18%) & incineration (10%)

421 ^a In China, quantitative empirical data on food waste recycled as feed for monogastric livestock was not available. We infer that the practices of feeding food waste to
 422 monogastric livestock in Japan and South Korea are rather similar to those in China, following Fang, et al. ¹⁰. Thus, we assumed that a similar proportion (39%, the
 423 mean of values in Japan and South Korea ¹¹) of food waste was being used as feed in China in 2014 in S0.

424 ^b The utilisation rates of by-products recycled as feed in China in 2014 in S0 were based on Fang, et al. ¹⁰.

425 ^c The current whereabouts of unused biomass were based on Kaza, et al. ¹².

426 Supplementary Table 3 | Physical quantities (Tg) of food waste and by-product waste to food waste
 427 recycling service and food waste collection service in China in S0.

	Physical quantity (Tg)		
	Total (Tg)	Food waste recycling service ^a	Food waste collection service ^a
Cereal grains waste ^b	36.09	14.08	22.02
Vegetables & fruits waste ^b	175.01	67.76	107.25
Roots & tubers waste ^b	13.32	5.20	8.13
Oilseeds & pulses waste ^b	1.27	0.50	0.78
Cereal bran waste ^c	19.97	0.00	19.97
Alcoholic pulp waste ^c	38.94	0.00	38.94
Oil cake waste ^c	26.59	0.00	26.59
Total	311.19	87.53	223.66

428 ^a Physical quantities of food waste recycling service and food waste collection service refer to how
 429 much food waste is recycled as feed for monogastric livestock production and how much food waste
 430 is collected for landfill and incineration.

431 ^b Physical quantities of food waste (i.e., cereal grains waste, vegetables & fruits waste, roots & tubers
 432 waste, and oilseeds & pulses waste) were quantified separately for each type of food product using
 433 data on food consumption and China-specific food loss and waste fractions ¹³ following the FAO
 434 methodology ¹⁴. In China, quantitative empirical data on food waste used as feed for monogastric
 435 livestock was not available. We infer that the practices of feeding food waste to monogastric
 436 livestock in Japan and South Korea are rather similar to those in China, following Fang, et al. ¹⁰.
 437 Thus, we assumed that a similar proportion (39%, the mean of values in Japan and South Korea ¹¹)
 438 of food waste was being used as feed in China in 2014 in S0, and the remaining food waste was
 439 collected for landfill and incineration.

440 ^c Physical quantities of by-product waste (i.e., cereal bran waste, alcoholic pulp waste, and oil cake
 441 waste) collected for landfill and incineration were estimated by detracting physical quantities of by-
 442 products recycled as feed for monogastric livestock (36%, 16%, 72% of total physical quantities of by-
 443 products according to Fang, et al. ¹⁰) from total physical quantities of by-products.

444 Supplementary Table 4 | Prices of food waste recycling service and food waste collection service in
 445 China. ^a

	Food waste treatment	Price ^b (dollar ton ⁻¹)	Weighted price ^c (dollar ton ⁻¹)
Food waste recycling service	Recycling waste as feed	54	54
Food waste collection service	Collection	40	82
	Landfill	31	
	Incineration	64	

446 ^a Food waste recycling service refers to recycling food waste as feed for monogastric livestock
 447 production, and food waste collection service means collecting food waste for landfill and
 448 incineration.

449 ^b The process of recycling food waste involves sorting, shredding, thermal treatment, fermentation,
 450 hydrolysis, and extrusion to create animal feed, as outlined by Alsaleh and Aleisa ¹⁵. Excluding the
 451 food waste recycled as feed, 66% of the remaining food waste in China in 2014 was collected for
 452 landfill, while 34% was incinerated, according to Kaza, et al. ¹² and Bhada-Tata and Hoornweg ¹⁶.
 453 Collection includes pick up, transfer, and transport to final disposal site for food waste. By
 454 multiplying the quantity of food waste with the price of food waste treatment, we can calculate the
 455 value of food waste generation. The prices of food waste recycling service and food waste collection
 456 service are obtained from Alsaleh and Aleisa ¹⁵, Kaza, et al. ¹² and Bhada-Tata and Hoornweg ¹⁶.
 457 Since the value of food waste generation needs to be taken from the 'wtr' demand of consumers and
 458 monogastric producers, we further checked whether or not the value of food waste generation is
 459 more than 80% of the initial demand of "wtr". If it is higher than 80% of the 'wtr' demand, the value
 460 of food waste generation is scaled down.

461 ^c The weighted price of food waste collection service = collection price (40 \$/t) + 66%*landfill price
 462 (31\$/t)+34%*incineration price (64\$/t)=82\$/t.

463 Supplementary Table 5 | The economic and mass allocation of main and by-products. ^a

	Main and by-products	By-product group	Economic share (%)	Mass share (%)
Cereal flour production ^a	Cereal flour	-	93%	86%
	Cereal bran	Cereal bran	7%	14%
Maize ethanol production ^b	Maize ethanol	-	83%	49%
	Distillers' grain from maize ethanol	Alcoholic pulp	17%	51%
Barley beer production ^b	Barley beer	-	98%	82%
	Brewers' grain from barley beer	Alcoholic pulp	2%	18%
Liquor production ^b	Liquor	-	97%	25%
	Distillers' grain from liquor	Alcoholic pulp	3%	75%
Vegetable oil production ^c	Soybean oil	-	44%	23%
	Soybean oil cake	Oil cake	56%	77%
	Other oil	-	66%	43%
	Other oil cake	Oil cake	34%	57%

Compound feed ^a	Split from the original “Food products nec (ofd)” sector
Cereal bran ^a	Split from the original “Food products nec (ofd)” sector
Alcoholic pulp ^a	Distiller’s grains from maize ethanol production split from the original “Food products nec (ofd)” sector; Distiller’s grains from liquor production and brewer’s grains from barley beer production split from the original “Beverages and Tobacco products (b_t)” sector
Oil cake ^a	Split from the original “Vegetable oils and fats (vol)” sector
Other food ^a	“Food products nec (ofd)” sector after splitting out splitting out compound feed, cereal bran, and distiller's grains from maize ethanol production; “Beverages and Tobacco products (b_t)” sector after splitting out distiller’s grains from liquor production and brewer’s grains from barley beer production; Vegetable oils and fats (vol)” sector after splitting out oil cake
Nitrogen fertiliser ^b	Split from the original “Manufacture of chemicals and chemical products (chm)” sector
Phosphorous fertiliser ^b	Split from the original “Manufacture of chemicals and chemical products (chm)” sector
Food waste recycling service ^c	Split from the original “Waste and water (wtr)” sector
Food waste collection service ^c	Split from the original “Waste and water (wtr)” sector
Fish	“Fishing (Fsh)” sector

Aggregated sectors	GTAP original sectors
Non-food	<p>“Manufacture of chemicals and chemical products (chm)” sector after splitting out nitrogen fertiliser and phosphorous fertiliser;</p> <p>“Waste and water (wtr)” sector after splitting out food waste recycling service and food waste collection service; “Forestry (fris)”, “Fishing (fsh)”, “Coal (coa)”, “Oil (oil)”, “Gas (gas)”, “Minerals nec (oxt)”, “Petroleum, coal products (p_c)”, “Electricity (ely)”, “Gas manufacture, distribution (gdt)”, “Textiles (tex)”, “Wearing apparel (wap)”, “Leather products (lea)”, “Wood products (lum)”, “Paper products, publishing (ppp)”, “Manufacture of pharmaceuticals, medicinal chemical and botanical products (bph)”, “Manufacture of rubber and plastics products (rpp)”, “Mineral products nec (nmm)”, “Ferrous metal (i_s)”, “Metal nec (nfm)”, “Metal products (fmp)”, “Electronic equipment (ele)”, “Manufacture of electrical equipment (eeq)”, “Manufacture of machinery and equipment n.e.c. (ome)”, “Motor vehicles and parts (mvh)”, “Transport equipment nec (otn)”, “Manufactures nec (omf)”, “Construction (cns)”, “Wholesale and retail trade; repair of motor vehicles and motorcycles (trd)”, “Accommodation, Food and service activities (afs)”, “Land transport and transport via pipelines (otp)”, “Warehousing and support activities (whs)”, “Sea transport (wtp)”, “Air transport (atp)”, “Communication (cmn)”, “Financial services nec (ofi)”, “Insurance (ins)”, “Real estate activities (rsa)”, “Other Business Services nec (obs)”, “Recreation & other services (ros)”, “Other Services (Government) (osg)”, “Education (edu)”, “Human health and social work (hht)”, “Dwellings: ownership of dwellings (imputed rents of houses occupied by owners) (dwe)” sectors</p>

476 ^a Compound feed was split from the “Food products nec (ofd)” sector in the original GTAP database. The substance flow from “Food products nec (ofd)” to
477 monogastric livestock and ruminant livestock was compound feed. Cereal bran and distiller’s grains from maize ethanol production were taken from the newly-split
478 sector of compound feed according to the shares of economic values of cereal bran and distiller’s grains from maize ethanol production in the total economic value of
479 compound feed. Economic values of cereal bran and distiller’s grains from maize ethanol production were calculated by multiplying the physical quantity (in tons) and
480 the corresponding price (dollar per ton). Distiller’s grains from liquor production and brewer’s grains from barley beer production were split from the “Beverages and
481 Tobacco products (b_t)” sector in the original GTAP database. The substance flow from “Beverages and Tobacco products (b_t)” to monogastric livestock were
482 distillers' grains from liquor production and brewers' grains from barley beer production. Oil cake was split from the “Vegetable oils and fats (vol)” sector in the original
483 GTAP database. The substance flow from the “Vegetable oils and fats (vol)” sector to monogastric livestock was oil cake.

484 ^b The nitrogen and phosphorus fertilisers were taken from the original 'Manufacture of chemicals and chemical products' sector following the method of Sturm ²⁷ and
485 Bartelings, et al. ²⁸.

486 ^c Food waste recycling service and food waste collection service were split from the “Waste and water (“wtr”)” sector in the original GTAP database according to the
487 shares of economic values of food waste recycling service and food waste collection service in the total economic value of “Waste and water (“wtr”)” sector. The
488 economic values of food waste recycling service and food waste collection service were calculated by multiplying the physical quantity (in tons) and the corresponding
489 price (dollar per ton). Since the value of food waste generation needs to be taken from the 'wtr' demand of consumers and monogastric producers, we further checked

490 whether or not the value of food waste generation is more than 80% of the initial demand of "wtr". If it is higher than 80% of the 'wtr' demand, the value of food waste
491 generation are scaled down.
